Muddy Children - the setting

Out of *n* children, *k* ≥ 1 got mud on their foreheads while playing.

- Out of *n* children, k ≥ 1 got mud on their foreheads while playing.
- They can see whether other kids are dirty, but there is no mirror for them to discover whether they are dirty themselves.

- Out of *n* children, k ≥ 1 got mud on their foreheads while playing.
- They can see whether other kids are dirty, but there is no mirror for them to discover whether they are dirty themselves.
- Then father walks in and states: "At least one of you is dirty!" Then he requests "If you know you are dirty, step forward now."

- Out of *n* children, k ≥ 1 got mud on their foreheads while playing.
- They can see whether other kids are dirty, but there is no mirror for them to discover whether they are dirty themselves.
- Then father walks in and states: "At least one of you is dirty!" Then he requests "If you know you are dirty, step forward now."
- If nobody steps forward, he repeats his request: "If you now know you are dirty, step forward now."

- Out of *n* children, k ≥ 1 got mud on their foreheads while playing.
- They can see whether other kids are dirty, but there is no mirror for them to discover whether they are dirty themselves.
- Then father walks in and states: "At least one of you is dirty!" Then he requests "If you know you are dirty, step forward now."
- If nobody steps forward, he repeats his request: "If you now know you are dirty, step forward now."
- After exactly *k* requests to step forward, the *k* dirty children suddenly do so (assuming they are honest and perfect reasoners).

A perfect logic for explaining the puzzle?

A perfect logic for explaining the puzzle?

The language of *Public Announcement Logic* (PAL [Pla89, GG97]) is defined as follows:

$$\phi \quad ::= \quad p \mid \phi \land \phi \mid \neg \phi \mid K_i \phi \mid [!\phi] \phi$$

A perfect logic for explaining the puzzle?

The language of Public Announcement Logic (PAL [Pla89, GG97]) is defined as follows:

 $\phi ::= \rho | \phi \land \phi | \neg \phi | K_i \phi | [!\phi] \phi$

It is interpreted on S5 models $\mathcal{M} = (S, \{\sim_i\}_{i \in I}, V)$:

 $\mathcal{M}, \boldsymbol{s} \models K_i \phi \quad \Leftrightarrow \quad \text{for all } t, \text{ if } \boldsymbol{s} \sim_i t \text{ then } \mathcal{M}, t \models \phi$ $\mathcal{M}, \boldsymbol{s} \models [!\psi]\phi \iff \text{if } \mathcal{M}, \boldsymbol{s} \models \psi \text{ then } \mathcal{M}|_{\psi}, \boldsymbol{s} \models \phi$

where $\mathcal{M}|_{\psi} = (S', \{\sim'_i\}_{i \in I}, V')$ with $S' = \{s \in S \mid \mathcal{M}, s \models \psi\},\$ $\sim'_i = \sim_i \cap (S' \times S')$, and $V' = V|_{S'}$

・ ロ ト ・ 雪 ト ・ 雪 ト ・ 日 ト

3

When there are 3 dirty children...

"At least one of you is dirty!" Announcement: $\psi_0 = D_1 \vee D_2 \vee D_3$

When there are 3 dirty children...

No one steps forward. Announcement: $\psi_1 = \neg K_1 D_1 \land \neg K_2 D_2 \land \neg K_3 D_3$

When there are 3 dirty children...

No one steps forward.

Announcement: $\psi_1 = \neg K_1 D_1 \land \neg K_2 D_2 \land \neg K_3 D_3$

When there are 3 dirty children...

$D_1 D_2 D_3$

Now all the children know that they are dirty. $\mathcal{M}_r(D_1D_2D_3) \models [!\psi_0][\psi_1][\psi_1]K_1D_1 \land K_2D_2 \land K_3D_3$

• Where was the father after the first announcement?

▲□▶ ▲□▶ ▲□▶ ▲□▶ = 三 のへで

▲□▶ ▲□▶ ▲三▶ ▲三▶ - 三 - のへの

Example (Procedural information is important)

$$A: a_1, a_2 \xrightarrow{\text{inform}} B: b_1, b_2$$

$$over hear$$

$$E: e$$

A "promising protocol" for this scenario is that A announces the disjunction of his actual hand (say 01) with all the different combinations of the remaining cards, so he would announce "I have 01 or 23 or 24 or 34."

◆□▶ ◆□▶ ◆□▶ ◆□▶ ● ● ● ●

Example (Procedural information is important)

$$A: a_1, a_2 \xrightarrow{\text{inform}} B: b_1, b_2$$

$$over hear$$

$$E: e$$

A "promising protocol" for this scenario is that A announces the disjunction of his actual hand (say 01) with all the different combinations of the remaining cards, so he would announce "I have 01 or 23 or 24 or 34."

It can go wrong if we assume...

- The goal of the protocol is commonly known.
- The procedure to generate the announcement is commonly known.

Example (Procedural information is important)

$$A: a_1, a_2 \xrightarrow{\quad \text{inform} \longrightarrow B : b_1, b_2}_{\quad \text{overhear}}$$

A "promising protocol" for this scenario is that A announces the disjunction of his actual hand (say 01) with all the different combinations of the remaining cards, so he would announce "I have 01 or 23 or 24 or 34."

"If you know the protocol and it is assumed to be correct, then it may turn incorrect!"

▲□▶ ▲□▶ ▲□▶ ▲□▶ = 三 のへで

Is it really perfect?

Where was the father?

▲□▶ ▲□▶ ▲□▶ ▲□▶ = 三 のへで

Is it really perfect?

- Where was the father?
- How to build a suitable model?

▲□▶ ▲□▶ ▲三▶ ▲三▶ - 三 - のへの

Is it really perfect?

- Where was the father?
- How to build a suitable model?
- What if there are a lot of children?

Protocols and their functions

Open Questions

Protocols and their functions

Protocols: in a very broad sense

Procedural rules that govern our everyday life

◆□▶ ◆□▶ ◆□▶ ◆□▶ ● ● ● ●

Protocols and their functions

Protocols: in a very broad sense

Procedural rules that govern our everyday life

Functions of protocols

• Let us know what to do (do *a* then do *b* or *c*).

▲□▶ ▲□▶ ▲三▶ ▲三▶ - 三 - のへの

Protocols and their functions

Protocols: in a very broad sense

Procedural rules that govern our everyday life

Functions of protocols

- Let us know what to do (do a then do b or c).
- Let us know the meaning of actions (if p then do a).

Protocols and their functions

Francois De La Rochefoucauld

True love is like ghosts, which everybody talks about and few have seen.

Open Questions

Protocols and their functions

Francois De La Rochefoucauld

True love is like ghosts, which everybody talks about and few have seen.

However...

You can actually show this ghost without seeing it or understanding what it is.

Protocol dynamics

This is how we did it in the past

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Protocol dynamics

Until something evil came in...

Häagen-Dazs: "Love her, take her to Häagen-Dazs".

Protocol dynamics

Until something evil came in...

Häagen-Dazs: "Love her, take her to Häagen-Dazs".

Protocol dynamics

Until something evil came in...

Häagen-Dazs: "Love her, take her to Häagen-Dazs".

The announcement of the slogan makes it commonly known that buying an icecream shows your love.

Protocol dynamics

Even "better": a true "father" can change his mind.

Protocol announcement logic

Previous research

Protocols are not specified in the logical languages in the existing work of Dynamic Epistemic Logic and Epistemic Temporal Logic [HY09, vBGHP09, Hos09, HF89, PR03]

To specify protocols and their dynamics explicitly!

Our logics are based on:

- Propositional Dynamic Logic (PDL [FL79])
- Public Announcement Logic (PAL [Pla89, GG97])

Protocol announcement logic

The first language PDL[!]

The formulas of PDL[!] are built from a set of basic proposition letters **P** and a finite set of atomic action symbols Σ as follows:

$$\phi ::= \top | \boldsymbol{p} | \neg \phi | \phi \land \phi | [\pi] \phi | [!\pi] \phi$$

$$\pi ::= \mathbf{1} | \mathbf{0} | \boldsymbol{a} | \pi \cdot \pi | \pi + \pi | \pi^*$$

Protocol announcement logic

The first language PDL!

The formulas of PDL[!] are built from a set of basic proposition letters **P** and a finite set of atomic action symbols Σ as follows:

$$\phi ::= \top | \mathbf{p} | \neg \phi | \phi \land \phi | [\pi] \phi | [!\pi] \phi \pi ::= \mathbf{1} | \mathbf{0} | a | \pi \cdot \pi | \pi + \pi | \pi^*$$

The language of regular expressions

$$\mathcal{L}(\mathbf{0}) = \emptyset \qquad \mathcal{L}(\mathbf{1}) = \{\epsilon\} \qquad \mathcal{L}(\mathbf{a}) = \{\mathbf{a}\} \\ \mathcal{L}(\pi \cdot \pi') = \{\mathbf{w}\mathbf{v} \mid \mathbf{w} \in \mathcal{L}(\pi), \mathbf{v} \in \mathcal{L}(\pi')\} \\ \mathcal{L}(\pi + \pi') = \mathcal{L}(\pi) \cup \mathcal{L}(\pi') \\ \mathcal{L}(\pi^*) = \{\epsilon\} \cup \bigcup_{n > 0} (\mathcal{L}(\underline{\pi \cdots \pi}))$$

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

Protocol announcement logic

The first language PDL[!]

The formulas of PDL[!] are built from a set of basic proposition letters **P** and a finite set of atomic action symbols Σ as follows:

$$\phi ::= \top | \boldsymbol{p} | \neg \phi | \phi \land \phi | [\pi] \phi | [!\pi] \phi$$

$$\pi ::= \mathbf{1} | \mathbf{0} | \boldsymbol{a} | \pi \cdot \pi | \pi + \pi | \pi^*$$

Example (The language of regular expressions)

 $(a + (b \cdot c))^* = \{\epsilon, a, bc, abc, aaa, bcbca \dots\}$

input derivative: \w

The language of the $\pi \setminus w$ of a regular expression π is defined as $\mathcal{L}(\pi \setminus w) = \{v \mid wv \in \mathcal{L}(\pi)\}.$

input derivative: \w

The language of the $\pi \setminus w$ of a regular expression π is defined as $\mathcal{L}(\pi \setminus w) = \{v \mid wv \in \mathcal{L}(\pi)\}$. We can axiomatize the operation $\setminus w$ (cf. [Brz64, Con71]).

input derivative: \w

The language of the $\pi \setminus w$ of a regular expression π is defined as $\mathcal{L}(\pi \setminus w) = \{v \mid wv \in \mathcal{L}(\pi)\}$. We can axiomatize the operation $\setminus w$ (cf. [Brz64, Con71]).We say $w \in \Sigma^*$ is *compliant with* π (notation: $w \propto \pi$) if $\pi \setminus w \neq \mathbf{0}$.

input derivative: \w

The language of the $\pi \setminus w$ of a regular expression π is defined as $\mathcal{L}(\pi \setminus w) = \{v \mid wv \in \mathcal{L}(\pi)\}$. We can axiomatize the operation $\setminus w$ (cf. [Brz64, Con71]).We say $w \in \Sigma^*$ is *compliant with* π (notation: $w \propto \pi$) if $\pi \setminus w \neq \mathbf{0}$.

Example (Deriving the remaining protocol)

$$(a + (b \cdot c))^* \backslash b = (a \backslash b + (b \cdot c) \backslash b) \cdot (a + b \cdot c)^* = (\mathbf{0} + (\mathbf{1} \cdot c)) \cdot (a + b \cdot c)^* = c \cdot (a + (b \cdot c))^*$$

Expressivity

Theorem

PDL[!] is equally expressive as test-free PDL.

Expressivity

$$\mathcal{M}, \boldsymbol{s} \models_{\pi} [\pi'] \phi \quad \Leftrightarrow \quad \text{for all } (\boldsymbol{w}, \boldsymbol{s}') : \text{ if } \boldsymbol{w} \in \mathcal{L}(\pi'), \boldsymbol{w} \propto \pi, \boldsymbol{s} \xrightarrow{\boldsymbol{w}} \boldsymbol{s}' \\ \text{ then } \mathcal{M}, \boldsymbol{s}' \models_{\pi \setminus \boldsymbol{w}} \phi$$

Proof.

By a translation:

$$\begin{array}{rcl} t(\phi) &=& t_{\boldsymbol{\Sigma}^*}(\phi) \\ t_{\pi}(\boldsymbol{p}) &=& \boldsymbol{p} \\ t_{\pi}(\neg\phi) &=& \neg t_{\pi}(\phi) \\ t_{\pi}(\phi_1 \land \phi_2) &=& t_{\pi}(\phi_1) \land t_{\pi}(\phi_2) \\ t_{\pi}([\pi']\phi) &=& \bigwedge_{i=0}^{k}([\theta_i]t_{\pi \setminus \pi_i}(\phi)) \\ t_{\pi}([!\pi']\phi) &=& \langle \pi' \rangle \top \to t_{\pi'}(\phi) \end{array}$$

The idea behind $t_{\pi}([\pi']\phi)$: partition $\{w \mid w \propto \pi \text{ and } w \in \mathcal{L}(\pi')\}$ by their consequences.

Other variations

Introducing $[!\pi(x)]$

 $\mathcal{M}, \boldsymbol{S} \models_{\pi} [!\pi'(\boldsymbol{X})] \phi \quad \Leftrightarrow \quad (\mathcal{M}, \boldsymbol{S} \models \langle \pi'(\pi) \rangle \top \implies \mathcal{M}, \boldsymbol{S} \models_{\pi'(\pi)} \phi)$

We can then concatenate, add, insert and repeat protocols by announcing $x \cdot \pi'$, $x + \pi'$, $\pi' + x$, and x^* respectively.

Other variations

Introducing $[!\pi(x)]$

$$\mathcal{M}, \boldsymbol{S} \models_{\pi} [!\pi'(\boldsymbol{X})] \phi \quad \Leftrightarrow \quad (\mathcal{M}, \boldsymbol{S} \models \langle \pi'(\pi) \rangle \top \implies \mathcal{M}, \boldsymbol{S} \models_{\pi'(\pi)} \phi)$$

We can then concatenate, add, insert and repeat protocols by announcing $x \cdot \pi'$, $x + \pi'$, $\pi' + x$, and x^* respectively.

Refinement operator $[!(a/\pi')]$

$$\mathcal{M}, \boldsymbol{s} \models_{\pi} [!(\boldsymbol{a}/\pi')] \phi \quad \Leftrightarrow \quad \mathcal{M}, \boldsymbol{s} \models \langle \pi[\boldsymbol{a}/\pi'] \rangle \top \implies \mathcal{M}, \boldsymbol{s} \models_{\pi[\boldsymbol{a}/\pi']} \phi$$

Aristotle said...

Love is composed of a single soul inhabiting two bodies.

Composing models: Joint work with van Eijck and Sietsma

Aristotle said...

Love is composed of a single soul inhabiting two bodies.

Definition (Merging Composition of "Partial" Kripke Models)

Given two models with the same set of agents I : $\mathcal{M} = (S, \mathbf{P}, \mathbf{I}, \sim, V)$ and $\mathcal{N} = (T, \mathbf{P}', \mathbf{I}, \sim', V')$, the *merging composition* $\mathcal{M} \oplus \mathcal{N}$ is given by $(S'', \mathbf{P} \cup \mathbf{P}', \mathbf{I}, \sim'', V'')$, where:

• $S'' = \{(s, t) \mid s \in S, t \in T, V(s) \cap \mathbf{P}' = V'(t) \cap \mathbf{P}\},\$

•
$$(s,s') \sim_i'' (t,t')$$
 iff $s \sim_i t$ and $s' \sim_i' t'$,

• $V''(s,t) = V(s) \cup V'(t)$.

Example (Composing Muddy Children)

・ロト・西ト・西ト・西・ うろの

We define the *unit* model \mathcal{E} as the model ({*s*}, \emptyset , **I**, ~, *V*) where $V(s) = \emptyset$ and $\sim_i = \{(s, s)\}$ for any *i*. In a picture:

◆□▶ ◆□▶ ◆□▶ ◆□▶ ● ● ● ●

We define the *unit* model \mathcal{E} as the model ({*s*}, \emptyset , **I**, ~, *V*) where $V(s) = \emptyset$ and $\sim_i = \{(s, s)\}$ for any *i*. In a picture:

Theorem

Kripke models with the same set of agents form a commutative monoid under the \oplus operation, with total bisimilarity as the appropriate equality notion. In particular, we have:

$$\begin{array}{cccc} \mathcal{E} \oplus \mathcal{M} & \leftrightarrows & \mathcal{M} \\ \mathcal{M} \oplus \mathcal{E} & \leftrightarrows & \mathcal{M} \\ \mathcal{M} \oplus (\mathcal{N} \oplus \mathcal{K}) & \leftrightarrows & (\mathcal{M} \oplus \mathcal{N}) \oplus \mathcal{K} \\ \mathcal{M} \oplus \mathcal{N} & \leftrightarrows & \mathcal{N} \oplus \mathcal{M} \end{array}$$

The commutative monoid yields the algebraic preordering \leq on the class of Kripke models with different vocabularies:

 $\mathcal{M} \leq \mathcal{N}$ iff there is a \mathcal{K} with $\mathcal{M} \oplus \mathcal{K} \hookrightarrow \mathcal{N}$.

▲□▶ ▲□▶ ▲三▶ ▲三▶ - 三 - のへの

The commutative monoid yields the algebraic preordering \leq on the class of Kripke models with different vocabularies:

 $\mathcal{M} \leq \mathcal{N}$ iff there is a \mathcal{K} with $\mathcal{M} \oplus \mathcal{K} \cong \mathcal{N}$.

Given two models \mathcal{M} and \mathcal{N} such that $\mathbf{P}_{\mathcal{M}} \subseteq \mathbf{P}_{\mathcal{N}}$, a left-simulation between \mathcal{M} and \mathcal{N} is a relation $R \subseteq S_{\mathcal{M}} \times S_{\mathcal{N}}$ such that *sRt* implies that the following hold:

Restricted Invariance $V_{\mathcal{M}}(s) = V_{\mathcal{N}}(t) \cap \mathbf{P}_{\mathcal{M}};$

Zag If for some $i \in I$ there is a $t' \in S_N$ with $t \xrightarrow{i} t'$ then there is a $s' \in S_M$ with $s \xrightarrow{i} s'$ and s'Rt'.

Theorem

For any models *M*, *N* with arbitrary vocabularies:

$$\mathcal{M} \leq \mathcal{N} \implies \mathcal{M} \stackrel{\leftarrow}{=} \mathcal{N}$$

Composing models

Theorem

For any models *M*, *N* with arbitrary vocabularies:

$$\mathcal{M} \leq \mathcal{N} \implies \mathcal{M} \stackrel{\leftarrow}{=} \mathcal{N}$$

Theorem

Let \mathcal{M} be a propositionally differentiated model. Then

$$\mathcal{M} \leq \mathcal{N} \iff \mathcal{M} \stackrel{\leftarrow}{=} \mathcal{N}$$

Theorem

If $\mathcal{M}, s \leq N, t$ then all formulas ϕ in the diamond fragment of $PDL_{\mathbf{P}_{\mathcal{M}},\mathbf{I}}$ are preserved from right to left under left simulation: if $N, t \models \phi$ then $\mathcal{M}, s \models \phi$. Equivalently, the box fragment of $PDL_{\mathbf{P}_{\mathcal{M}},\mathbf{I}}$ is preserved from left to right under left simulation.

Theorem

If $\mathcal{M}, s \leq N$, t then all formulas ϕ in the diamond fragment of $PDL_{\mathbf{P}_{\mathcal{M}},\mathbf{I}}$ are preserved from right to left under left simulation: if $N, t \models \phi$ then $\mathcal{M}, s \models \phi$. Equivalently, the box fragment of $PDL_{\mathbf{P}_{\mathcal{M}},\mathbf{I}}$ is preserved from left to right under left simulation.

Theorem

If a pointed model (\mathcal{M}, s) is decomposable into models $(\mathcal{M}_0, s_0), \ldots, (\mathcal{M}_n, s_n)$ with disjoint vocabularies $\mathbf{P}_0, \mathbf{P}_1, \ldots, \mathbf{P}_n$, then for any i: $\mathcal{M}_i, s_i \cong_{\mathbf{P}_i} \mathcal{M}, s$. Therefore for any ϕ in $PDL_{\mathbf{P}_i,\mathbf{I}} : \mathcal{M}_i, s_i \models \phi \iff \mathcal{M}, s \models \phi$.

We say \mathcal{M} is *locally generated* if, for every agent *i*, there is a non-empty set of boolean formulas Φ_i (the set of local observables) based on $\mathbf{P}_{\mathcal{M}}$ such that:

for all $s, s' \in S_M$, $s \sim_i s'$ iff for all $\varphi \in \Phi_i$, $M, s \models \varphi \Leftrightarrow M, s' \models \varphi$

◆□▶ ◆□▶ ◆□▶ ◆□▶ ● ● ● ●

We say \mathcal{M} is *locally generated* if, for every agent *i*, there is a non-empty set of boolean formulas Φ_i (the set of local observables) based on $\mathbf{P}_{\mathcal{M}}$ such that:

for all $s, s' \in S_M$, $s \sim_i s'$ iff for all $\varphi \in \Phi_i$, $M, s \models \varphi \Leftrightarrow M, s' \models \varphi$

Theorem (Decomposition by agents)

Given a set of agent $I = \{1, 2, ..., n\}$. If $\mathcal{M} = (S, \mathbf{P}, I, \sim, V)$ is locally generated w.r.t. $\Phi_1, ..., \Phi_n$, then there are models $\mathcal{M}_1, ..., \mathcal{M}_n$ and \mathcal{M}_0 such that:

- $\mathcal{M} \hookrightarrow (\mathcal{M}_0 \oplus \mathcal{M}_1 \oplus \cdots \oplus \mathcal{M}_n);$
- $|S_{\mathcal{M}_i}| \leq |S|$ and \mathcal{M}_i is bisimulation contracted model;
- $\mathbf{P}_{\mathcal{M}_j} = \{ \boldsymbol{p} \in \mathbf{P}_{\mathcal{M}} \mid \boldsymbol{p} \text{ appears in } \Phi_j \} \text{ for } j > 0;$

Counting models: joint work with Siestma

In Anna Karenina:

All happy families are happy alike, all unhappy families are unhappy in their own way.

My question is...

How many different kinds of unhappiness are there?

Counting models: joint work with Siestma

In Anna Karenina:

All happy families are happy alike, all unhappy families are unhappy in their own way.

In other words...

Given a finite set of *formulas*, how many *different* models are there?

Counting models: joint work with Siestma

In Anna Karenina:

All happy families are happy alike, all unhappy families are unhappy in their own way.

In other words...

Given a finite set of *formulas*, how many *different* models are there?

To be more precise, we consider:

- modal µ-calculus formulas
- bisimulation as the equivalence notion between models
- only image-finite models

Modal μ -calculus [Koz83]

 $\phi \quad ::= \quad \top \mid \perp \mid X \mid p \mid \bar{p} \mid \phi \land \phi \mid \phi \lor \phi \mid \langle a \rangle \phi \mid [a] \phi \mid \mu X.\phi \mid \nu X.\phi$

Very expressive: $\mu X.\Box X$ which expresses well-foundedness. It is shown in [vBI08] that Mu is closed under product update.

Definition (µ-automata [JW95, DN05])

A μ -automaton A on set of basic propositions **P** and set of basic actions **S** is a tuple: A = (Q, B, q_0, \rightarrow_{OR}, \rightarrow_{BR}, L, \Omega).

Modal μ -calculus [Koz83]

 $\phi \quad ::= \quad \top \mid \perp \mid X \mid p \mid \bar{p} \mid \phi \land \phi \mid \phi \lor \phi \mid \langle a \rangle \phi \mid [a] \phi \mid \mu X.\phi \mid \nu X.\phi$

Very expressive: $\mu X.\Box X$ which expresses well-foundedness. It is shown in [vBI08] that Mu is closed under product update.

However, we do not work with formulas directly but..

Definition (µ-automata [JW95, DN05])

A μ -automaton A on set of basic propositions **P** and set of basic actions **S** is a tuple: A = (Q, B, q_0, \rightarrow_{OR}, \rightarrow_{BR}, L, \Omega).

 μ automata recognizes (infinite) trees. Let $\mathcal{L}(A)$ be the language of A, i.e., the set of trees which are accepted by A.

Theorem ([JW95])

For each μ -automaton there is an equivalent Mu-formula. For each Mu-formula there is an equivalent μ -automaton.

▲□▶ ▲□▶ ▲三▶ ▲三▶ - 三 - のへの

Theorem ([JW95])

For each μ -automaton there is an equivalent Mu-formula. For each Mu-formula there is an equivalent μ -automaton.

Da C

Theorem

Let A be a μ -automaton. Then the following are equivalent:

$$\ \, |\mathcal{L}(A)|_{/\underline{\leftrightarrow}}=2^{\aleph_0},$$

$$2 |\mathcal{L}(A)|_{/\leftrightarrow} > \aleph_0,$$

 £(A) contains a tree with infinite non-bisimilar subtrees (non-B-regular tree).

▲□▶ ▲□▶ ▲三▶ ▲三▶ - 三 - のへの

This generalizes an earlier work by Niwiński [Niw91].

Theorem

Let A be a μ -automaton. Then the following are equivalent:

$$\ \, |\mathcal{L}(A)|_{/\underline{\leftrightarrow}}=2^{\aleph_0},$$

$$2 |\mathcal{L}(A)|_{/ \underset{}{\hookrightarrow}} > \aleph_0,$$

Solution $\mathcal{L}(A)$ contains a tree with infinite non-bisimilar subtrees (non-B-regular tree).

This generalizes an earlier work by Niwiński [Niw91].

Proof.

Hard part: (3) \implies (1). The strategy is as follows:

Show every non-B-tree has an infinite "non-bisimilar " path.

Theorem

Let A be a μ -automaton. Then the following are equivalent:

$$\ \, |\mathcal{L}(A)|_{/\underline{\leftrightarrow}}=2^{\aleph_0},$$

$$2 |\mathcal{L}(A)|_{/\leftrightarrow} > \aleph_0,$$

Solution $\mathcal{L}(A)$ contains a tree with infinite non-bisimilar subtrees (non-B-regular tree).

This generalizes an earlier work by Niwiński [Niw91].

Proof.

Hard part: (3) \implies (1). The strategy is as follows:

- Show every non-B-tree has an infinite "non-bisimilar " path.
- Based on the special path, "Pump" a non-B-regular tree in *L*(A) tree into 2⁸₀ non-bisimilar trees.

Theorem

Let A be a μ -automaton. Then the following are equivalent:

$$\ \, |\mathcal{L}(A)|_{/\underline{\leftrightarrow}}=2^{\aleph_0},$$

$$2 |\mathcal{L}(A)|_{/ \underset{}{\hookrightarrow}} > \aleph_0,$$

Solution $\mathcal{L}(A)$ contains a tree with infinite non-bisimilar subtrees (non-B-regular tree).

This generalizes an earlier work by Niwiński [Niw91].

Proof.

Hard part: (3) \implies (1). The strategy is as follows:

- Show every non-B-tree has an infinite "non-bisimilar " path.
- Based on the special path, "Pump" a non-B-regular tree in L(A) tree into 2⁸₀ non-bisimilar trees.
- Show that all these tree are accepted by A.

Lemma

Given a μ -automaton A, if $\mathcal{L}(A)$ is countable up to bisimulation then $|alive(\mathcal{L}(A))|_{/\cong}$ is finite.

◆□▶ ◆□▶ ◆ □▶ ◆ □▶ ● □ ● ● ●

Lemma

Given a μ -automaton A, if $\mathcal{L}(A)$ is countable up to bisimulation then $|alive(\mathcal{L}(A))|_{/\cong}$ is finite.

Theorem (Normal form of countable languages)

Given a μ -automaton A, if $\mathcal{L}(A)$ is countable up to bisimulation, then it can be represented by

$$F_n[x_1 \setminus \mathcal{T}_1, \ldots, x_1 \setminus \mathcal{T}_n]$$

for some $n < \omega$, $\{\mathcal{T}_1, \ldots, \mathcal{T}_n\} \subseteq$ alive $(\mathcal{L}(A))$, and some $F_n \subseteq \mathfrak{F}_n$ which is recognizable by an finite automaton B on finite trees in \mathfrak{F}_n .

Model Abstraction

Good representations may help.

More than 10²⁰ states can be handled by *symbolic model checking* [BCM⁺92].

However, it is never enough...

However, it is never enough...

Example (Guessing the other number)

a and *b* are given two natural numbers *n* and n + 1 respectively. They are told that what they have are two consecutive natural numbers, but they do not know who has the bigger one. We can build the following model (suppose *n* is an even number):

$$\mathbf{s_0}: (n, n+1) (n, n-1) (n-2, n-1) (0, 1)$$

Abstraction w.r.t. PAL: with Dechesne & Orzan

Definition (Kripke Modal Labelled Transition System [HJS01])

A Kripke Modal Labelled Transition System (KMLTS) is a tuple $\mathcal{M} = (S, \mathbf{P}, \mathbf{\Sigma}, \rightarrow, \rightarrow, V)$ where:

- \rightarrow is a set of transitions of the form $s \xrightarrow{i} s'$ where $i \in \Sigma$;
- *V* is a valuation function: $V : S \rightarrow \{true, false, \uparrow\}^{P}$.

We require that $\rightarrow \subseteq \cdots$.

Translation of the formulas

Definition (Translation of formulas)

Given signatures (\mathbf{I}', P') , (\mathbf{I}, P) , and surjective functions $f : \mathbf{I}' \to \mathbf{I}, g : P' \to P$, we define the translation of an $PAL_{\mathbf{I},P'}$ -formula ϕ into an $PAL_{\mathbf{I},P}$ -formula $\ulcorner \phi \urcorner_{f,g}$ inductively as follows:

$$\begin{array}{rcl} \ulcorner p' \urcorner_{f,g} & = & g(p') \\ \ulcorner \neg \psi \urcorner_{f,g} & = & \neg \ulcorner \psi \urcorner_{f,g} \\ \ulcorner \psi_1 \land \psi_2 \urcorner_{f,g} & = & \ulcorner \psi_1 \urcorner_{f,g} \land \ulcorner \psi_2 \urcorner_{f,g} \\ \ulcorner K_{i'} \psi \urcorner_{f,g} & = & K_{f(i')} \ulcorner \psi \urcorner_{f,g} \\ \ulcorner [\chi] \psi \urcorner_{f,g} & = & [\ulcorner \chi \urcorner_{f,g}] \ulcorner \psi \urcorner_{f,g} \end{array}$$

Translation of the formulas

Definition (Translation of formulas)

Given signatures (\mathbf{I}', P') , (\mathbf{I}, P) , and surjective functions $f : \mathbf{I}' \to \mathbf{I}, g : P' \to P$, we define the translation of an $PAL_{\mathbf{I},P'}$ -formula ϕ into an $PAL_{\mathbf{I},P}$ -formula $\ulcorner \phi \urcorner_{f,g}$ inductively as follows:

$$\begin{bmatrix} p'^{\gamma}_{f,g} &= g(p') \\ \neg \psi^{\gamma}_{f,g} &= \neg^{\Gamma} \psi^{\gamma}_{f,g} \\ \psi_{1} \wedge \psi_{2}^{\gamma}_{f,g} &= \Gamma \psi_{1}^{\gamma}_{f,g} \wedge^{\Gamma} \psi_{2}^{\gamma}_{f,g} \\ \Gamma K_{i'} \psi^{\gamma}_{f,g} &= K_{f(i')} \Gamma \psi^{\gamma}_{f,g} \\ \Gamma [\chi] \psi^{\gamma}_{f,g} &= [\Gamma \chi^{\gamma}_{f,g}]^{\Gamma} \psi^{\gamma}_{f,g}$$

Example

 $\lceil [p \land q \land r] K_1 p \lor K_2 q \rceil_{f,g} = [P \land R] K_A P \text{ with } f(1) = f(2) = A;$ g(p) = g(q) = P and g(r) = R.

Logical Characterization

Lemma

$(\mathcal{N}, t) \Subset_{f,g} (\mathcal{M}, s)$ implies $(\mathcal{N}|_{\chi}, t) \Subset_{f,g} (\mathcal{M}|_{\ulcorner_{\chi}\urcorner_{f,g}}, s)$ under certain condition.

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ● ○ ○ ○ ○

Logical Characterization

Lemma

$$(\mathcal{N}, t) \Subset_{f,g} (\mathcal{M}, s)$$
 implies $(\mathcal{N}|_{\chi}, t) \Subset_{f,g} (\mathcal{M}|_{\ulcorner_{\chi}\urcorner_{f,g}}, s)$ under certain condition.

Theorem

 $(\mathcal{N}, t) \Subset_{f,g} (\mathcal{M}, s) \text{ implies for all } \phi \in PAL_{\mathbf{I}, P'} : \\ \llbracket \ulcorner \phi \urcorner_{f,g} \rrbracket^{\mathcal{M}, s} \leq \llbracket \phi \rrbracket^{\mathcal{N}, t}.$

Logical Characterization

Lemma

 $(\mathcal{N}, t) \Subset_{f,g} (\mathcal{M}, s)$ implies $(\mathcal{N}|_{\chi}, t) \Subset_{f,g} (\mathcal{M}|_{\ulcorner_{\chi}\urcorner_{f,g}}, s)$ under certain condition.

Theorem

 $(\mathcal{N}, t) \Subset_{f,g} (\mathcal{M}, s) \text{ implies for all } \phi \in PAL_{\mathbf{f}, P'} :$ $\llbracket \ulcorner \phi \urcorner_{f,g} \rrbracket^{\mathcal{M}, s} \leq \llbracket \phi \rrbracket^{\mathcal{N}, t}.$

Theorem

If for every formula $\phi \in PAL_{I,P'}$: $\llbracket \phi \urcorner_{f,g} \rrbracket^{\mathcal{M},s} \leq \llbracket \phi \rrbracket^{\mathcal{N},t}$ then $(\mathcal{N},t) \Subset_{f,g} (\mathcal{M},s)$ (Image finitness assumed).

Muddy Children - Abstraction of n=3 case

Abstractions of the Muddy Children for n = 3 children. f(1) = f(2) = A, f(3) = 3 and g = Id. D_3 means proposition D_3 has valuation \perp in the current state.

First announcement: $\ulcorner D_1 \lor D_2 \lor D_3 \urcorner_{f,g} = D_1 \lor D_2 \lor D_3$.

▲□▶▲圖▶▲≣▶▲≣▶ ≣ のQ@

 ${}^{\mathsf{r}}K_3 D_3 {}^{\mathsf{r}}_{f,q} = K_3 D_3$ holds at world D_3 . Announcement can be made if more than one child is dirty: $\ulcorner \neg K_1 D_1 \land \neg K_2 D_2 \land \neg K_3 D_3 \urcorner_{f,q} = \neg K_A D_1 \land \neg K_A D_2 \land \neg K_3 D_3.$

 $\lceil K_1 D_1 \rceil_{f,q} = K_A D_1$ holds at world $D_1 D_3$ and $\lceil K_1 D_2 \rceil_{f,q} = K_A D_2$ holds at $D_2 D_3$. If all the three children are dirty then announce: $\lceil \neg K_1 D_1 \land \neg K_2 D_2 \land \neg K_3 D_3 \rceil_{f,g} = \neg K_A D_1 \land \neg K_A D_2 \land \neg K_3 D_3.$

$D_1 D_2 D_3$

${}^{}\mathcal{K}_1D_1 \wedge K_2D_2{}^{}^{}_{f,g} = K_AD_1 \wedge K_AD_2$ holds at the only world.

Question: how to model check PDL on AMLTS?

▲□▶ ▲□▶ ▲三▶ ▲三▶ 三三 のへで

PDL on Accelerated Models: with Chen & van de Pol

Question: how to model check PDL on AMLTS?

Recall the semantics:

$$\mathcal{M}, \boldsymbol{s} \models \langle \boldsymbol{\pi} \rangle \phi \quad \Leftrightarrow \quad \text{there exists a path } \boldsymbol{s} \xrightarrow{\pi_1} \boldsymbol{s}_1 \xrightarrow{\pi_2} \cdots \xrightarrow{\pi_n} \boldsymbol{s}_n :$$
$$\mathcal{M}, \boldsymbol{s}_n \models \phi \text{ and } \mathcal{L}(\pi_1 \cdots \pi_n) \subseteq \mathcal{L}(\pi)$$

PDL on Accelerated Models: with Chen & van de Pol

Question: how to model check PDL on AMLTS?

Recall the semantics:

$$\mathcal{M}, \boldsymbol{s} \models \langle \boldsymbol{\pi} \rangle \phi \quad \Leftrightarrow \quad \text{there exists a path } \boldsymbol{s} \xrightarrow{\pi_1} \boldsymbol{s}_1 \xrightarrow{\pi_2} \cdots \xrightarrow{\pi_n} \boldsymbol{s}_n : \\ \mathcal{M}, \boldsymbol{s}_n \models \phi \text{ and } \mathcal{L}(\pi_1 \cdots \pi_n) \subseteq \mathcal{L}(\pi)$$

Example $s^{-a+b} \bullet$ $t \stackrel{a}{\smile} b \rightarrow \bullet$ $\mathcal{M}, s \models \langle a + b + c \rangle \top$ $\mathcal{M}, t \models \langle a + b + c \rangle \top$ $\mathcal{M}, s \nvDash \langle a \rangle \top$ $\mathcal{M}, t \models \langle a \rangle \top \land \langle b \rangle \top$

A straightforward idea which is hard to implement: reduce the new to the old.

PDL on Accelerated Models

Regular Expression Rewriting [CDGLV02]

Given a regular expression π , rewrite π , if possible, by a set of other regular expressions $\mathcal{E} = \{\pi_0, \pi_1, \dots, \pi_n\}$.

PDL on Accelerated Models

Regular Expression Rewriting [CDGLV02]

Given a regular expression π , rewrite π , if possible, by a set of other regular expressions $\mathcal{E} = \{\pi_0, \pi_1, \dots, \pi_n\}$. For example, we can rewrite $a^* \cdot d$ by $\{a \cdot a^*, d\}$: $a \cdot a^* \cdot d + d$.

PDL on Accelerated Models

Regular Expression Rewriting [CDGLV02]

Given a regular expression π , rewrite π , if possible, by a set of other regular expressions $\mathcal{E} = \{\pi_0, \pi_1, \dots, \pi_n\}$. For example, we can rewrite $a^* \cdot d$ by $\{a \cdot a^*, d\}$: $a \cdot a^* \cdot d + d$. In most of the cases, we do not have an exact rewriting. e.g., try to rewrite a + b by $\{a\}$. In such cases we are interested in the *maximal* rewriting.

PDL on Accelerated Models

In such cases we are interested in the *maximal* rewriting.

Theorem

([CDGLV02]) There is an essentially optimal algorithm to compute the maximal \mathcal{E} -rewriting of a given π w.r.t a given set \mathcal{E} in 2-Exptime.

PDL on Accelerated Models

Definition (Rewriting PDL formula w.r.t. an accelerated model)

Given an AKM \mathcal{M} and a PDL_{Σ} formula ϕ , let $\langle \rangle_{\mathcal{M}}$ be the set of labels in \mathcal{M} , $\mathfrak{R}_{\mathcal{M}}(\phi)$ is the rewriting of ϕ in the language PDL_{$\Sigma_{\phi_{\mathcal{M}}}$} defined by:

•
$$\Re_{\mathcal{M}}(\langle \pi \rangle \psi) = \langle \widehat{\pi}_{\langle \rangle_{\mathcal{M}}} \rangle \Re_{\mathcal{M}}(\psi).$$

PDL on Accelerated Models

Definition (Rewriting PDL formula w.r.t. an accelerated model)

Given an AKM \mathcal{M} and a PDL_{Σ} formula ϕ , let $\langle \rangle_{\mathcal{M}}$ be the set of labels in \mathcal{M} , $\mathfrak{R}_{\mathcal{M}}(\phi)$ is the rewriting of ϕ in the language PDL_{$\Sigma_{\phi_{\mathcal{M}}}$} defined by:

•
$$\mathfrak{R}_{\mathcal{M}}(\langle \pi \rangle \psi) = \langle \widehat{\pi}_{\langle \rangle_{\mathcal{M}}} \rangle \mathfrak{R}_{\mathcal{M}}(\psi).$$

Theorem

For any pointed AKM M, s and any PDL₂ formula ϕ ,

 $\mathcal{M}, s \models \phi \iff \ulcorner \mathcal{M} \urcorner, s \Vdash \mathfrak{R}_{\mathcal{M}}(\phi).$

PDL on Accelerated Models

We also give a direct model checking algorithm by using the following proposition:

Theorem

Given a pointed AKM $\mathcal{M} = (S, \Sigma, \rightarrow, V, s_0)$ and $T \subseteq S$, if $T = \{t \mid \mathcal{M}, t \models \phi\}$, then we have:

$$\mathcal{M}, \mathbf{S}_0 \models \langle \pi \rangle \phi \iff \mathcal{L}(\mathcal{M} \otimes_T \mathbf{A}_{\pi}) \neq \emptyset$$

where A_{π} denotes the deterministic automaton corresponding to π .

We can reduce the problem of the existence of the non-empty rewriting to model checking problem.

there is a non-empty rewriting of π w.r.t. $\mathcal{E} \iff \mathcal{M}_{\mathcal{E}}, \mathbf{s} \models \langle \pi \rangle \phi$.

Theorem

Model checking PDL on AKM is Expspace-complete.
PDL on Accelerated Models

Definition

Rewriting of a PDL⁺ formula Given a PDL⁺ formula ϕ , let $\langle \rangle_{\phi}$ be the set $\{\pi \mid \langle \pi \rangle \text{ appears in } \phi\}, \Re(\phi)$ is the rewriting of ϕ in the language PDL $_{\mathbf{r}}^+$ defined by:

- $\Re(\langle \pi \rangle(\psi)) = \langle e_{\pi} \rangle \Re(\psi).$ $\Re([\pi]\psi) = [\widehat{\pi}_{\langle \rangle_{\phi}}] \Re(\psi).$

PDL on Accelerated Models

Definition

Rewriting of a PDL⁺ formula Given a PDL⁺ formula ϕ , let $\langle \rangle_{\phi}$ be the set $\{\pi \mid \langle \pi \rangle \text{ appears in } \phi\}, \Re(\phi)$ is the rewriting of ϕ in the language PDL $_{\mathbf{r}}^+$ defined by:

• $\Re(\langle \pi \rangle(\psi)) = \langle e_{\pi} \rangle \Re(\psi).$ • $\Re([\pi]\psi) = [\widehat{\pi}_{\langle\rangle_{\phi}}]\Re(\psi).$

Theorem

Given a PDL⁺ formula ϕ, ϕ is satisfiable on an AKM $\iff \Re(\phi)$ is satisfiable on a standard Kripke model.
